

Database Schema.

IT AUDIT TOOL — ENTITY-RELATIONSHIP DIAGRAM

14 July 2026

What this diagram shows

All 13 application tables in the local PostgreSQL database, generated directly from the live schema (server/src/db/migrations). The internal pgmigrations bookkeeping table is omitted as it is not part of the application data model.

Legend

- Mint stripe + bold row — Primary Key (PK)
- Grey stripe — Foreign Key (FK)
- Mint line with arrowhead — foreign-key relationship (arrow points to the referenced table)

Note: images.entity_id and concern_flags.entity_id are polymorphic references (resolved in application code via entity_type) and are not enforced by a DB-level FK constraint.

Tables included

- | | | |
|------------------------|------------------------|------------------|
| • customers | • networks | • vendor_support |
| • sites | • active_directory | • images |
| • audits | • infrastructure_items | • concern_flags |
| • audit_sites | • comms_rooms | |
| • internet_connections | • software | |

Full column-level detail (types, keys, relationships) is on the diagram page that follows.
